One half of the same core not so much bent was put on two supports 20 1/2 ins. apart, and required a load of 428 lbs., to break it. This indicates a tensile resistance at the extreme fiber of 205 lbs. per sq. in. In another experiment a metal tube 7 1/2 ins. in diameter was filled with Portland cement and bent so that the radius of curvature of its neutral axis was 21.6 ins. The metal shell was then removed and a piece of cement cut out. The cement which had been subjected to this great deformation did not break and only showed a few cracks on the compression side. Another test described by Considere was as follows: A specimen mixed with the proportions of 1 part of cement to 4.3 parts of sand and gravel withstood a pressure of 10,270 lbs. per sq. in. with a maximum longitudinal shortening of 2.8 per cent, and an average shortening of 2.4 per cent. After the removal of the reinforcement the concrete core sustained a pressure of 924 lbs. per sq. in. Another specimen withstood a pressure of 6,970 lbs. per sq. in., with a shortening of 0.6 per cent., and after the removal...
